

waterproof and flexible pipe is required. Most types of rubber tubing do not adhere them; they are, therefore, most used for short lengths of hose, as they require no oil or dressing to keep them pliable. The most flexible tubing is made of polyethylene, which is available in 1/2 in. and 3/4 in. diameters. It is available in 100 ft. lengths for carrying hot or cold water to health resorts. Polyethylene and prism may be used on application to the rubber tubing industry. H.B. Vannoy, India-Rubber Goods Co., 1000 Main St., New York 17, N.Y.
